Executive Summary

This document provides the risk adjustment covariates and coefficients for relevant Agency for Healthcare Research and Quality (AHRQ) Quality Indicators (QI) Pediatric Quality Indicators (PDI). Descriptions of the categories are provided in the Appendix tables at the end of the document. Certain AHRQ QIs (such as PDI 11 – Postoperative Wound Dehiscence) are not risk adjusted because materially important risk factors are not available in the Healthcare Cost and Utilization Project (HCUP) State Inpatient Database (SID).

The PDI present the stratifications as part of the technical specifications (i.e., one examines the observed rates by stratification) for relevant PDI. The stratifications are included only for the PDI because the population of interest consists of complex patients for whom the stratified rates are most informative. These stratifications are presented as covariates in the risk adjustment models.

Additional information on the AHRQ QI risk adjustment process can be found in the AHRQ QI Empirical Methods report, available here.
NQI #01 – Neonatal Pneumothorax Rate

This measure was examined for risk adjustment. Because of the infrequency of the event and the subsequent limited predictive power of the standard risk adjustment covariates used, risk adjustment coefficients are unavailable.

PDI #11 – Postoperative Wound Dehiscence Rate

This measure was examined for risk adjustment. Because of the infrequency of the event and the subsequent limited predictive power of the standard risk adjustment covariates used, risk adjustment coefficients are unavailable.

Table A.2. Modified Diagnosis-Related Group (MDRG) Categories

Column Headings
- MDC – Major Diagnostic Category
- M/S – Medical / Surgical DRG Indicator
- MDRG – Modified DRG
- CMS-DRG – Diagnosis-Related Group (DRG) Version 24 and earlier
- MS-DRG – Diagnosis-Related Group (DRG) Version 25 and later

The modified DRG (MDRG) pools individual CMS-DRGs and MS-DRGs into a larger category. The MDRG is a four digit code. The first two digits are the MDC, and the second two digits are a sequence number (e.g., 01-04) within MDC. CMS-DRGs that are divided into separate CMS-DRGs due to the presence of complications and comorbidities (CC) are pooled into a single MDRG. MS-DRGs that are divided into separate MS-DRGs due to the presence of CC and Major CC (MCC) are pooled into a single MDRG. The CMS crosswalk was used to pool CMS-DRGs and MS-DRGs into a single MDRG.
